

Skylark Drones - Assignment

Technical Assignment: [Monday.com](https://monday.com) Business Intelligence Agent

Problem Statement

Founders and executives need quick, accurate answers to business questions across multiple data sources. Currently, this requires:

- Manually pulling data from monday.com boards
- Cleaning inconsistent data formats
- Querying information across multiple boards (work orders, deals, pipeline)
- Creating ad-hoc analysis for each query
- Dealing with missing data and incomplete records

The Challenge

Business data is messy. A founder asks "How's our pipeline looking for energy sector this quarter?" and someone needs to interpret that query, find relevant data across multiple boards, clean it, and provide meaningful insights

Your Task

Build an AI agent that can answer founder-level business intelligence queries by integrating with monday.com boards containing work orders and deals data.

Sample Data

You will receive two CSV files to import into monday.com:

1. **Work Orders** - Project execution data
2. **Deals** - Sales pipeline data

P.S - Import these into monday.com as separate boards. Set up appropriate column types and structure as you see fit.

Note: The data is real-world messy data - Your agent must handle this gracefully.

Core Features

Your agent must handle these areas:

1. [Monday.com](https://monday.com) Integration

- Connect to monday.com via MCP or API
- Handle authentication and connection management

2. Data Resilience

- Handle missing/null values gracefully
- Normalize inconsistent date formats, naming conventions, text fields
- Provide meaningful results even with incomplete data
- Communicate data quality issues or caveats to the user

3. Query Understanding

- Interpret founder-level business questions
- Ask clarifying questions when needed

4. Business Intelligence

- Answer queries about revenue, pipeline health, sectoral performance, operational metrics
- Query across both boards when needed
- Provide context and insights, not just raw numbers

Additional Requirement (optional)

- "The agent should help prepare data for leadership updates"

How you interpret and implement this is up to you. Document your interpretation in your Decision Log.

Integration Requirements

[Monday.com](#) — Read only

- **Read:** All data from both boards (Work Orders and Deals)
- Use MCP or API — your choice
- **Important:** Do not hardcode CSV data. Your agent must query [monday.com](#) dynamically.

Deliverables

1. Hosted Prototype (Required)

- Working agent accessible via link
- Platform of your choice
- Must be testable without local setup

2. Decision Log (Required, 2 page max)

- Key assumptions you made
- Trade-offs chosen and why
- What you'd do differently with more time
- How you interpreted "leadership updates"

3. Source Code

- ZIP file
- README with architecture overview and setup instructions for monday.com configuration

Technical Expectations

1. **Conversational Interface:** The user will interact with your agent conversationally, handle that to the best of your (agents') ability
2. **[Monday.com](https://monday.com) Integration:** Via MCP or API as specified above
3. **Error Handling:** Graceful handling of data quality issues and API failures
4. **Tech Stack:** Your choice — justify your decisions in the Decision Log

Timeline

6 hours

Questions?

If you have clarifying questions, document your assumptions and proceed. Part of the evaluation is seeing how you handle ambiguity and make decisions with incomplete information.

Good luck!
